

A Rapid Computer-assisted Systematic Map of Regional Climate Impacts

March 12, 2020

Systematic assessments of the evidence on Climate Change like those conducted by the IPCC are vital.

Systematic assessments of the evidence on Climate Change like those conducted by the IPCC are vital.

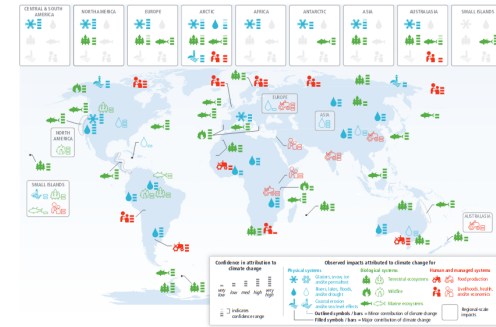

Figure 10-3 Global patterns of observed climate change impacts reported since ARI. Early flood symbol in the top panel indicates a case of systems for which climate change has played a major role in observed changes in at least one system within that class across the respective region, with the range of confidence in attribution for those region-wide impacts indicated by the color. Regional scale impacts where climate change has played a minor role are shown by smaller symbols in a box in the respective region. Sub-regional impacts are indicated with symbols on the map, placed in the approximate area of their occurrence. The reported areas can vary from specific locations to broad areas, such as a major river basin. Impacts on physical (blue), biological (green), and human (red) systems are differentiated by color. This map represents a graphical synthesis of tables 10.5, 10.6, 10.7, 10.8, and 10.9. Absence of climate change impacts from this figure does not imply that such impacts have not occurred.

► These are challenged by big literature

- ▶ Machine learning can help

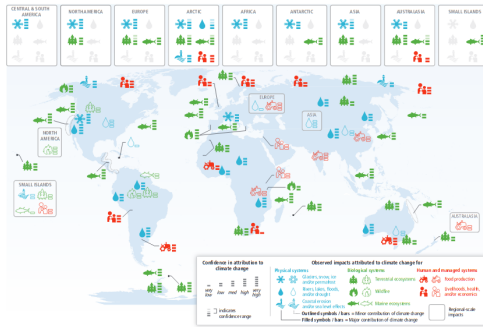

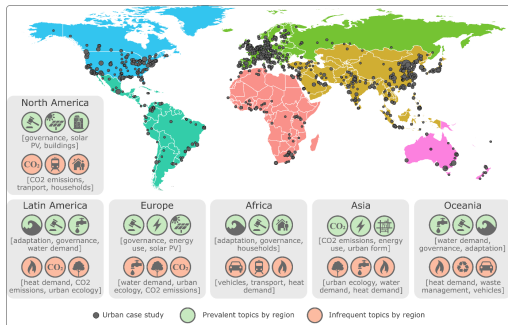

Figure 18-13 | Global patterns of observed climate change impacts reported since ARI. Each filled symbol in the top panels indicates a class of systems for which climate change has played a major role in observed changes in at least one system within that class across the respective region, with the range of confidence in attribution for those region-wide impacts indicated by the bars. Regional scale impacts where climate change has played a minor role are shown by outlined symbols in a box in the respective region. Sub-regional impacts are indicated with symbols on the map, placed in the approximate area of their occurrence. The impacted area can vary from specified locations to broad areas such as a major river basin. Impacts on physical (blue), biological (green), and human (red) systems are differentiated by color. This map represents a graphical synthesis of Tables 18-5, 18-6, 18-7, 18-8, and 18-9. Absence of climate change impacts from this figure does not imply that such impacts have not occurred.

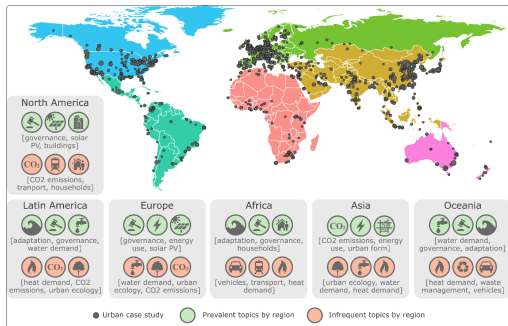

Rapid, Computer-assisted Systematic Mapping

- We produced a systematic map of the literature on urban mitigation

Lamb, W. F., Creutzig, F., Callaghan, M. W., and Minx, J. C. (2019). [Learning about urban climate solutions](#). *Nature Climate Change*, 9(4):279–287

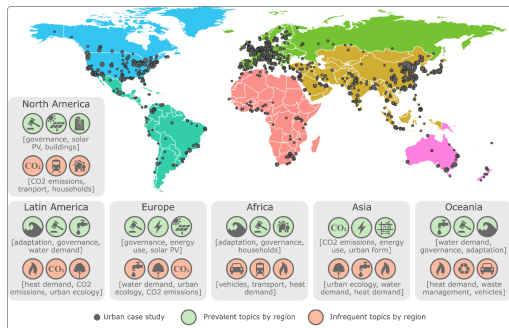

Rapid, Computer-assisted Systematic Mapping

- ▶ We produced a systematic map of the literature on urban mitigation
- ▶ Using topic models (unsupervised learning) we were able to describe the thematic content of research and show how that varied by region

Lamb, W. F., Creutzig, F., Callaghan, M. W., and Minx, J. C. (2019). [Learning about urban climate solutions](#). *Nature Climate Change*, 9(4):279–287

With regional impact attribution literature, we have specific categories we are looking for, and a small dataset of labelled documents

Proposal

We plan to use the labelled data from AR5 WGII Table 18-5 - 18-9 to train a classifier that can identify literature relevant to the different impact categories, in the corresponding map.

This will require more screening, for the generation of further validation and training data

The results can

- ▶ contribute to the production of the map in AR6
- ▶ inform us about research gaps
- ▶ enhance our understanding of the what literature what was included in the last map, and what, if any, other information could have been included

Table 18-5 | Observed impacts of climate change reported since AR4 on mountains, snow, and ice, over the past several decades, across major world regions, with descriptors for (1) the confidence in detection of a climate change impact; (2) the relative contribution of climate change to the observed change, compared to that of non-climatic drivers; (3) the main climatic driver(s) causing the impacts; (4) the reference behavior of the system in the absence of climate change; and (5) the confidence in attribution of the impacts to climate change. References to related chapters in this report are given as well as key references to other IPCC reports and the scientific literature. Absence of climate change impacts from this table does not imply that such impacts have not occurred.

	Mountains, snow and ice	References	Confidence in detection	Role of climate	Climate driver	Reference behavior	Confidence in attribution
Africa	Retreat of tropical highland glaciers in East Africa	Milg et al. (2008, 2012); Taylor et al. (2009)	Very high	Major	Warming, drying	No change	High
Europe	Retreat of Alpine, Scandinavian, and Icelandic glaciers	WGI AR5 Section 4.3.3; Bauder et al. (2007); Björnsson and Pálsson (2008); Paul and Haeberli (2008); WGMS (2008); Zemp et al. (2009); Andreassen et al. (2012); Marzoni et al. (2012); Gardner et al. (2013)	Very high	Major	Warming	No change	High
	Increase in rock slope failures in western Alps	Sections 1.8.3.1.3 and 2.3.3.1.4; Fischer et al. (2012); Nagel et al. (2013a)	High	Major	Warming	No change	Medium
Asia	Permafrost degradation in Siberia, Central Asia, and the Tibetan Plateau	WGI AR5 Section 4.7.2; Section 24.4.2.2; Romanovsky et al. (2010); Yang et al. (2013)	High	Major	Warming	No change	High

Machine Learning Approach

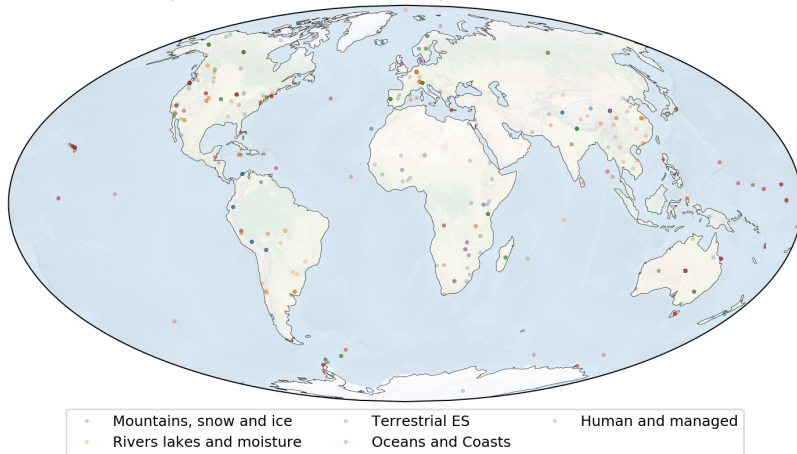

- ▶ We use the text of the documents to train a model to categorise the documents we know the categories for
- ▶ We use that model to predict the categories of documents we haven't seen yet
- ▶ We screen these documents, providing validation and more training data

Proof of Concept

Proof of Concept

Climate impact attribution research: 844 place mentions in 257 documents

Proof of Concept - unseen data

We view the same documents in the context of a sample of 10,000 new documents

Proof of Concept - unseen data

We view the same documents in the context of a sample of 10,000 new documents

- We can train the model on the known documents, and use it to predict the categories of the unseen documents

Proof of Concept - unseen data

We view the same documents in the context of a sample of 10,000 new documents

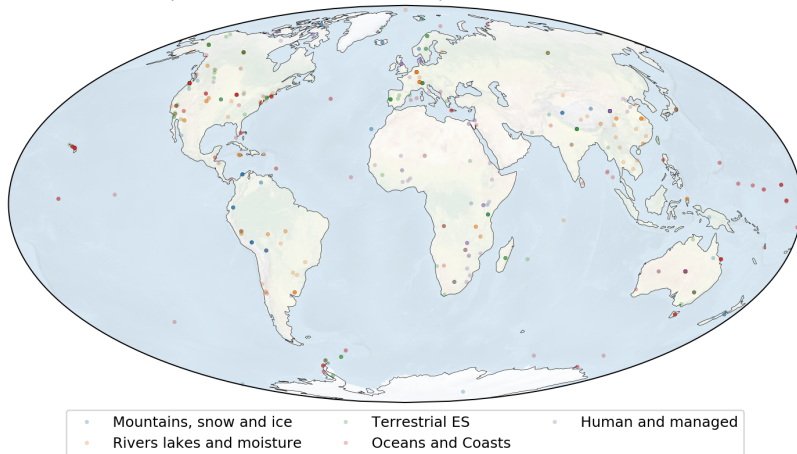

- ▶ We can train the model on the known documents, and use it to predict the categories of the unseen documents
- ▶ About 40% of documents are predicted to be relevant (!), but the model is only trained on positive cases

Proof of Concept - unseen data

Recall the original map of places mentioned in the AR5 documents

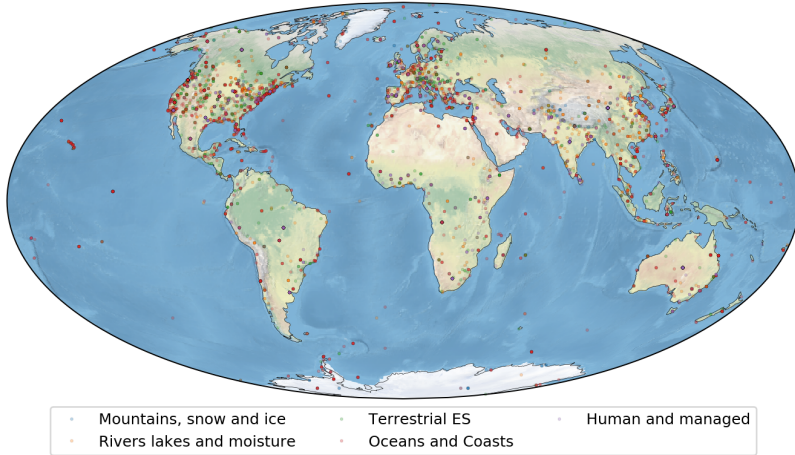

Climate impact attribution research: 844 place mentions in 257 documents

Proof of Concept - unseen data

In just a sample of 10,000 documents, we have a lot more places mentioned, and regional concentrations are clearer

Climate impact attribution research: 29431 place mentions in 9963 documents

Screening so far

- ▶ A random sample of 500 documents
- ▶ A sample of 200 predicted to be relevant

Screening task

Query Screener (Query no. 7368) - Welcome, galm, your progress:

Detection of regional climate change effects on alpine hydrology by daily resolution trend analysis in Tyrol, Austria

377719

JOURNAL OF WATER AND CLIMATE CHANGE (2015) 124 - 143 10.2166/wcc.2014.099 Document type: Article

Kormann, Christoph | Univ Potsdam, Inst Earth & Environm Sci, D-14476 Potsdam, Germany.; Franke, Till | Univ Potsdam, Inst Earth & Environm Sci, D-14476 Potsdam, Germany.; Bronstert, Axel | Univ Potsdam, Inst Earth & Environm Sci, D-14476 Potsdam, Germany.].

Author keywords: Alps; hydroclimatology; Mann-Kendall test; streamflow; trend detection

WoS Keywords Plus: WESTERN NORTH-AMERICA; SNOW COVER; STREAMFLOW TRENDS; UNITED-STATES; PRECIPITATION; RUNOFF; ALPS; TEMPERATURE; SWITZERLAND; HEMISPHERE

Owing to average temperature increases of at least twice the global mean, climate change is expected to have strong impacts on local hydrology and climatology in the Alps. Nevertheless, trend analyses of hydro-climatic station data rarely reveal clear patterns concerning climate change signals except in temperature observations. However, trend research has thus far mostly been based on analysing trends of averaged data such as yearly, seasonal or monthly averages and has therefore often not been able to detect the finer temporal dynamics. For this reason, we derived 30-day moving average trends, providing a daily resolution of the timing and magnitude of trends within the seasons. Results are validated by including different time periods. We studied daily observations of mean temperature, liquid and solid precipitation, snow height and runoff in the relatively dry central Alpine region in Tyrol, Austria. Our results indicate that the vast majority of changes are observed throughout spring to early summer, most likely triggered by the strong temperature increase during this season. Temperature, streamflow and snow trends have clearly amplified during recent decades. The overall results are consistent over the entire investigation area and different time periods.

Done

Screening task

Query criteria

Include documents that relate broadly to the detection and attribution of the impacts of climate change in particular regions

Attribution

Mark whether the document relates to

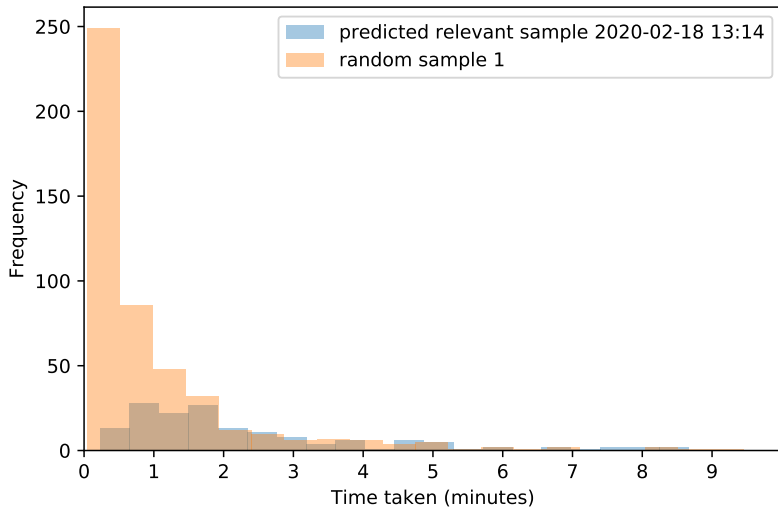

- **Climate Attribution:** The link between greenhouse gas or aerosol emissions and climate-related forcings
- **Climate impact Attribution:** The impacts of long-term changes in climate-related forcings on natural and human systems beyond a specified baseline which characterizes its behaviour in the absence of climate change
- **Weather sensitivity:** The response of a system to fluctuations in weather including individual weather extremes
- **Impact event attribution:** The effects of individual weather extremes on natural or human systems (e.g. was the reported occurrence of cholera triggered by an associated flood event)
- **Climate event attribution:** The attribution of individual climatic extreme events to greenhouse gas and aerosol emissions

Where a study mentions attributed impacts (from other research) but the study is about predicting / modelling future impacts - include as modeling.

Exclusion

- Document describes a research programme that will look at impacts
- Document describes something that will become important with projected climate change
- Models or methodological improvements that will be useful for understanding climate impacts
- Is **only** about measuring a climate signal, temperature/precipitation trends, without a discussion of how that impacts e.g. drought or floods
- Global impacts without specific regional impacts
